Dissolved organic matter (DOM) - microbe interactions

Christian Lønborg

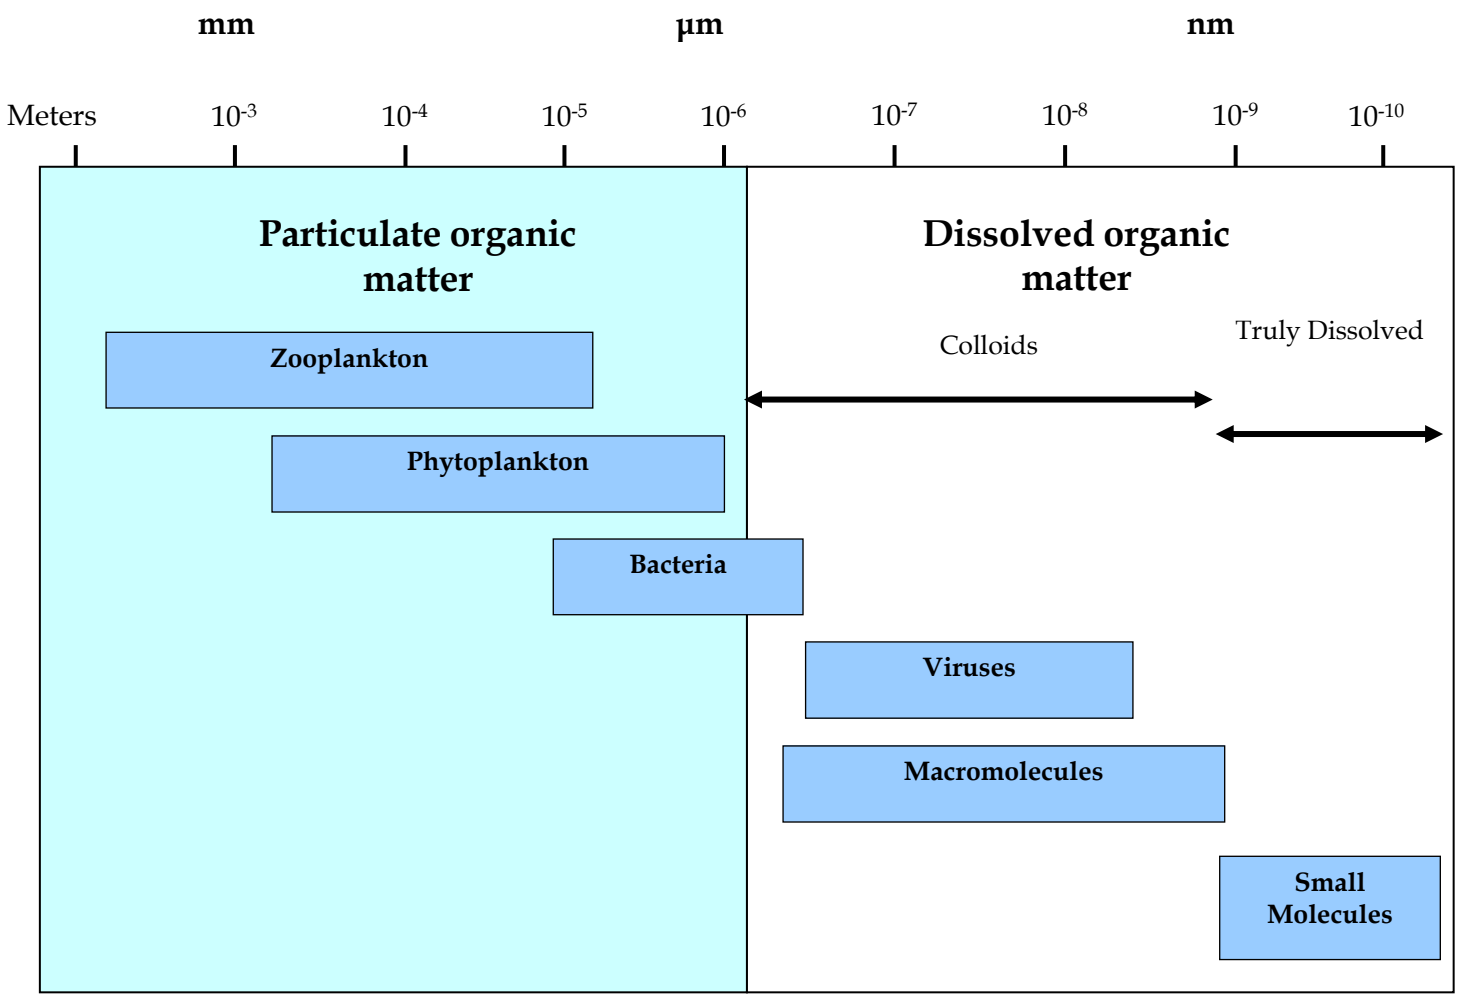
Swansea University
Prifysgol Abertawe

Swansea University, College of Biosciences, Swansea, UK

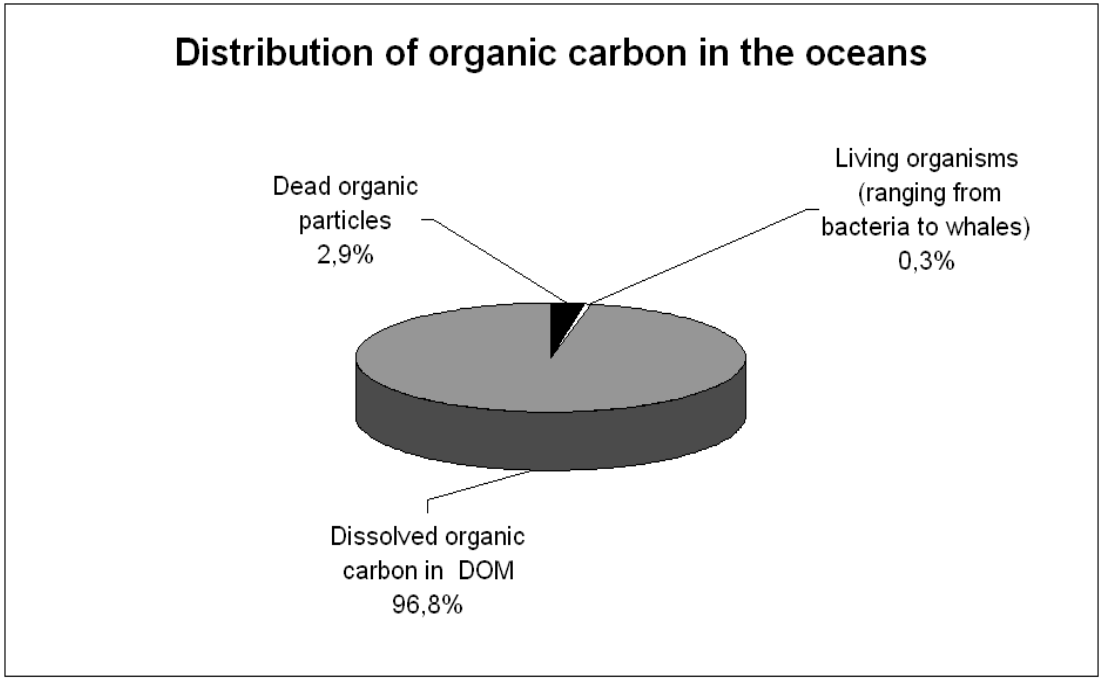
Overview

- DOM introduction and why do we care?
- Case studies: 1. Bacterial DOM degradation
  2. Bacterial and UV DOM degradation
- Research needs

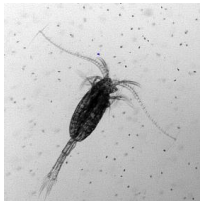
What is dissolved organic matter (DOM)?



Why dissolved organics matter?

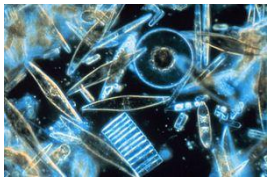


- 60% of nitrogen and phosphorus are in DOM



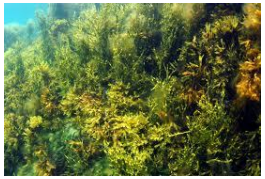
Zooplankton

Antropogenic



Phytoplankton

UV-light



Macrophytes

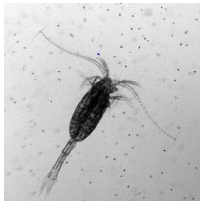
DOM

Sediment

Bacteria

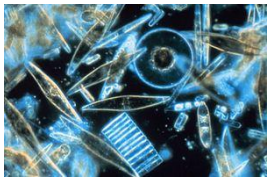
Rivers

Aggregation



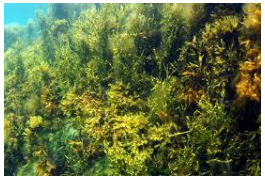
Zooplankton

Antropogenic



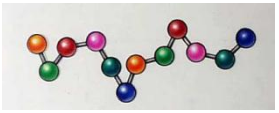
Phytoplankton

UV-light



Macrophytes

DOM



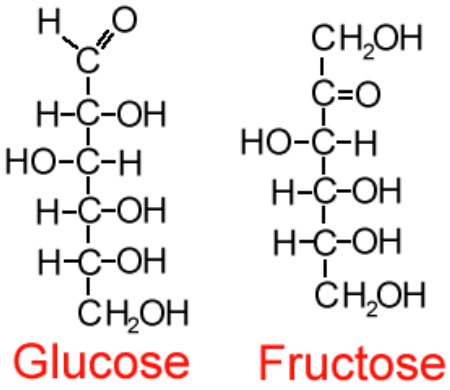
Sediment

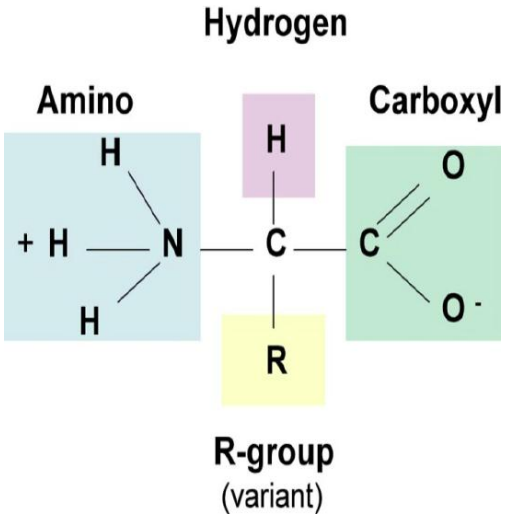
Bacteria

Rivers

Aggregation

DOM composition





~15% of the bulk DOM pool in coastal ocean

DOM

Dissolved organic carbon (DOC)

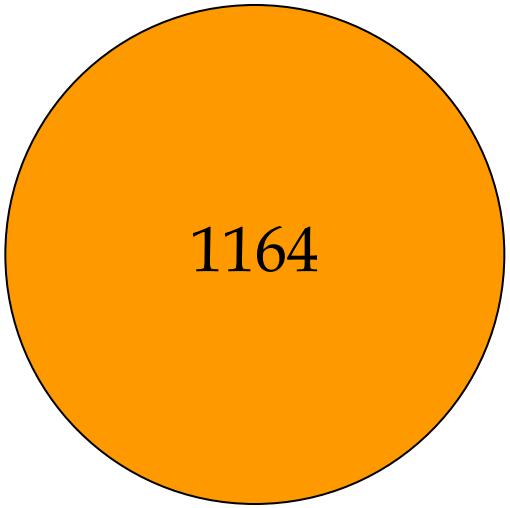
e. g. Carbohydrates

Dissolved organic nitrogen (DON)

e. g. Proteins

Dissolved organic phosphorus (DOP)

e. g. DNA



DOM bioavailability

Degraded =

Bioavailable (BDOM)

Non-degraded =

Refractory (RDOM)

Case study 1: Bacterial DOM degradation

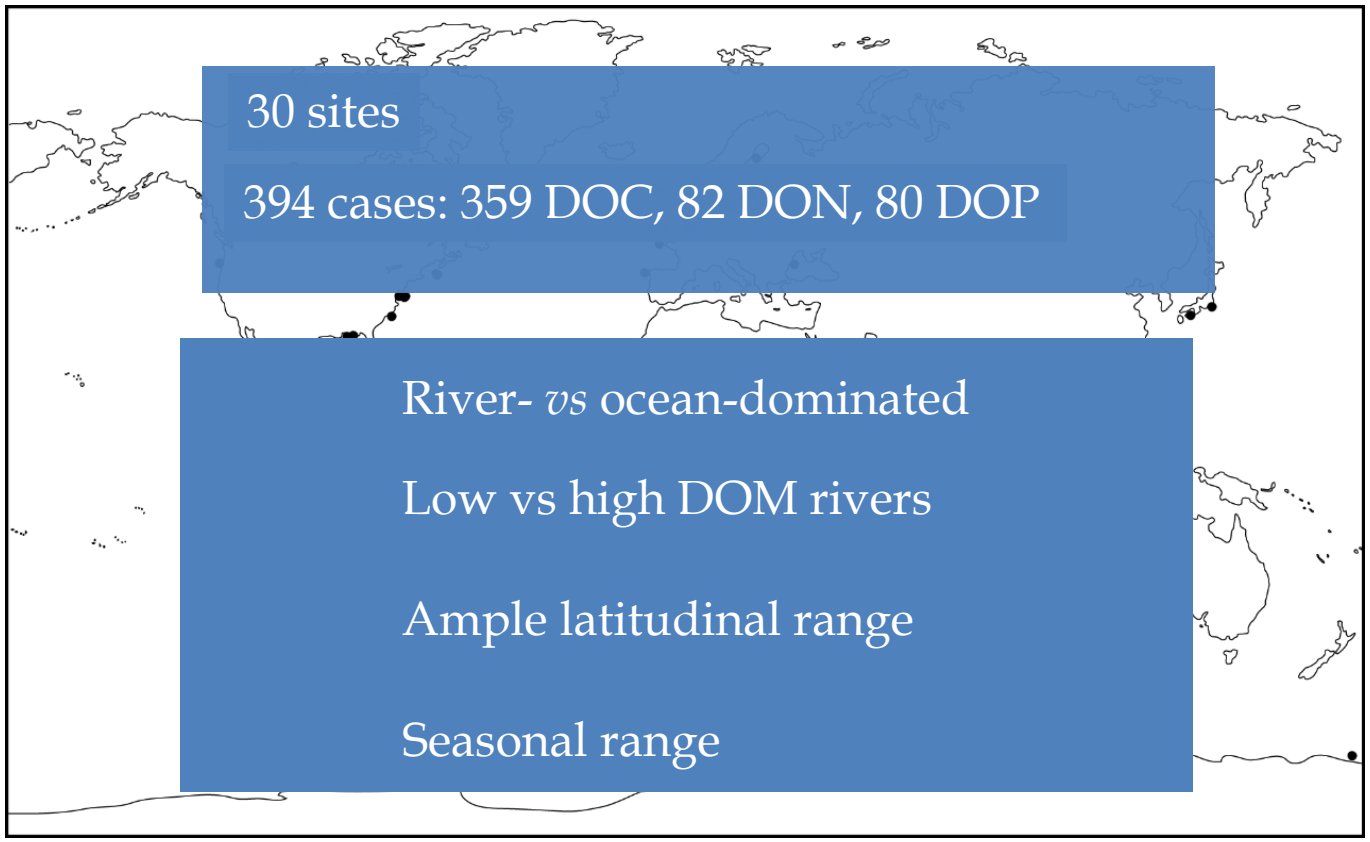
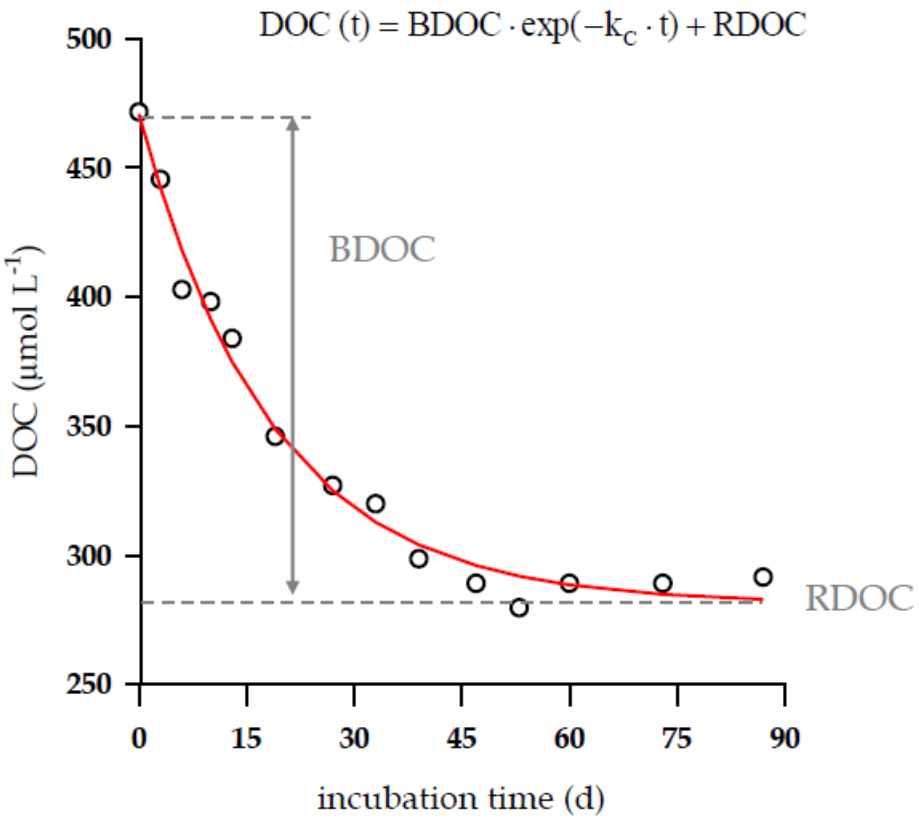
Coastal DOM database



Lønborg & Álvarez-Salgado (2012)

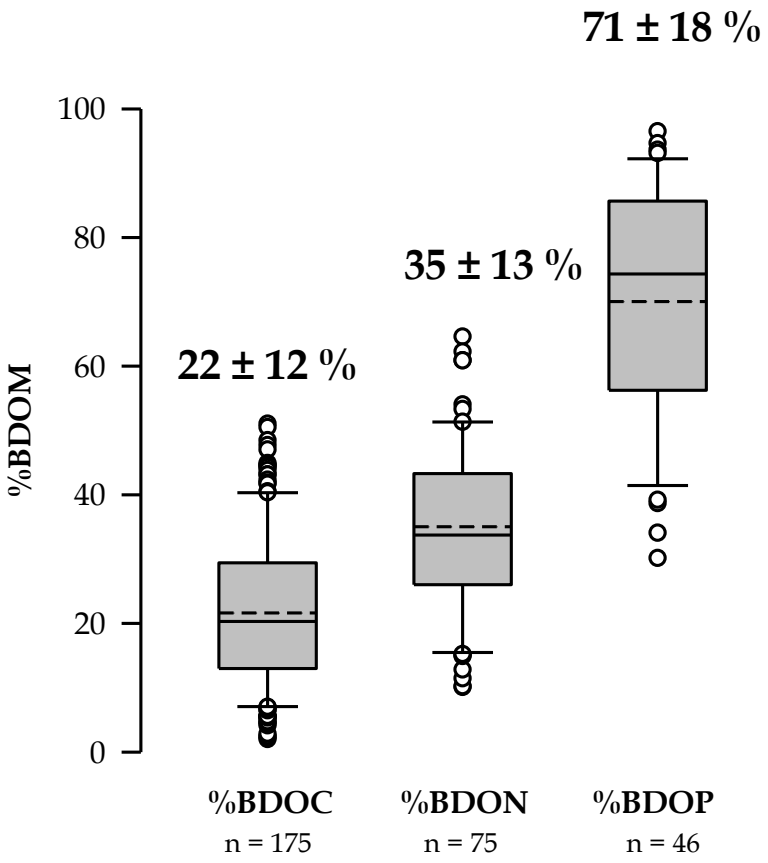
Microbial degradation of DOM



Included only incubations > 40 days

Pempkowiak (1985)

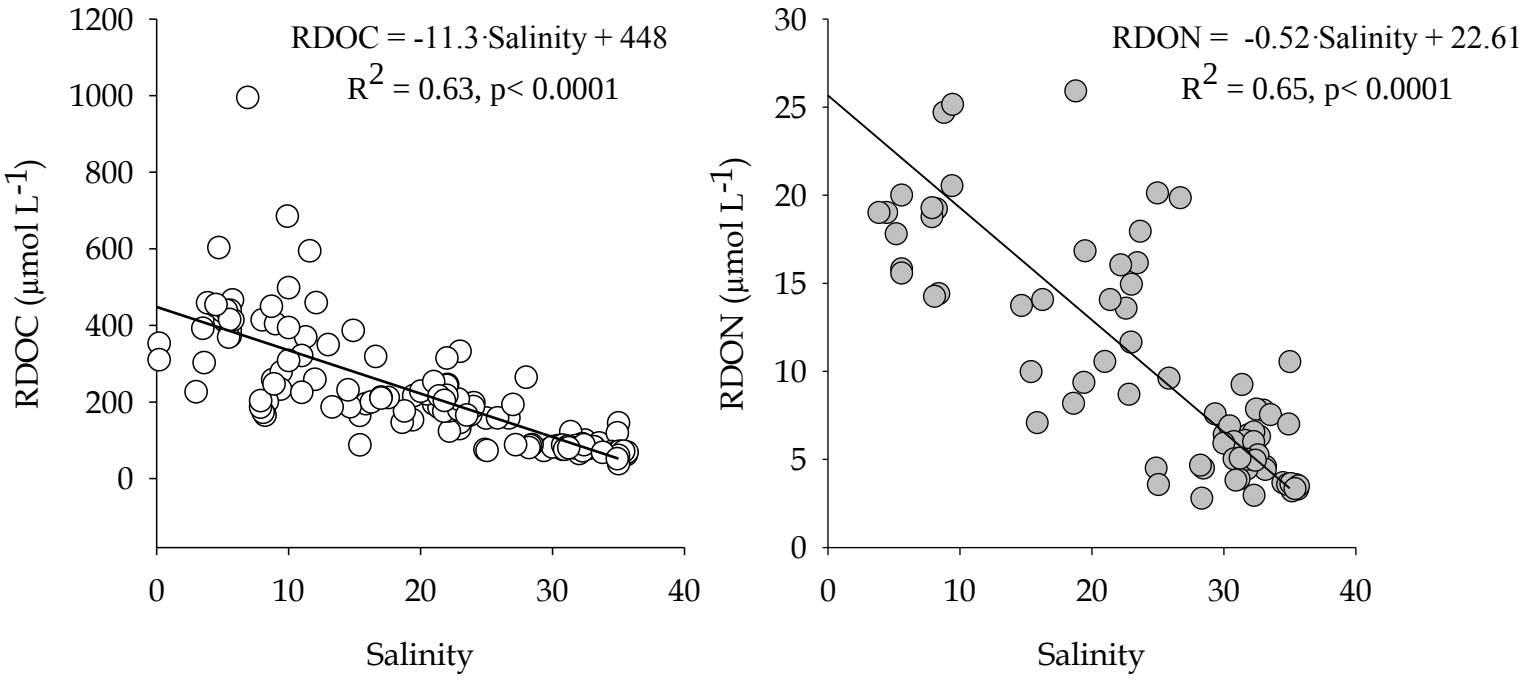
Bioavailability of DOM



Bioavailability gradient : P > N > C

Lønborg & Álvarez-Salgado (2012)

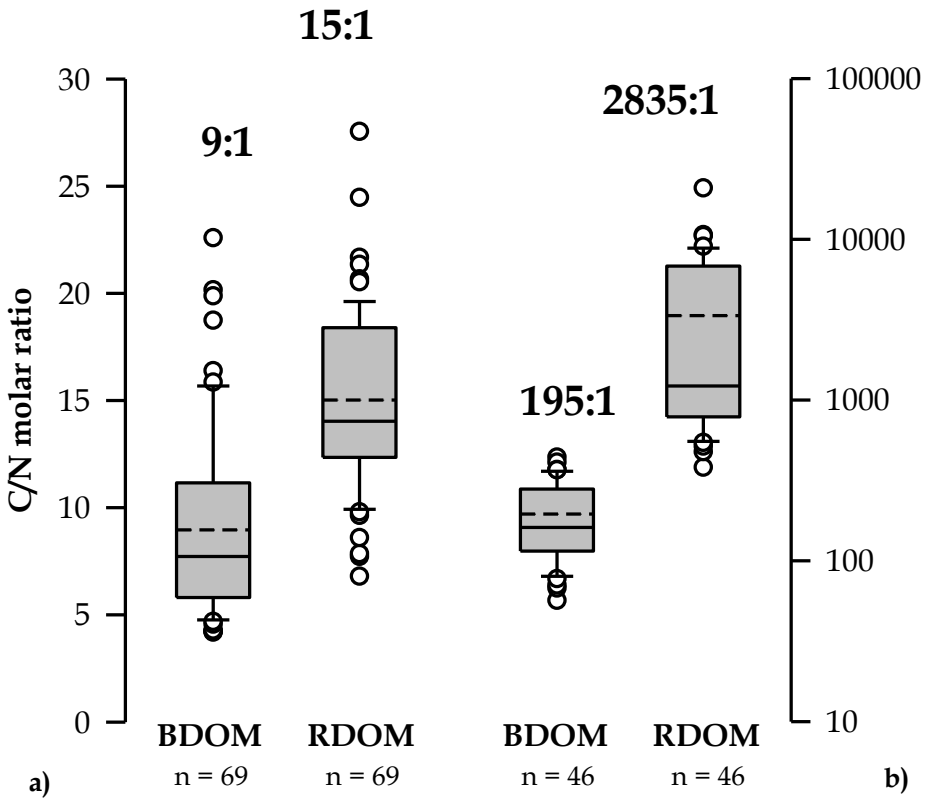
Refractory DOM



River DOM more refractory → moves conservatively

Lønborg & Álvarez-Salgado (2012)

C:N:P stoichiometry of DOM

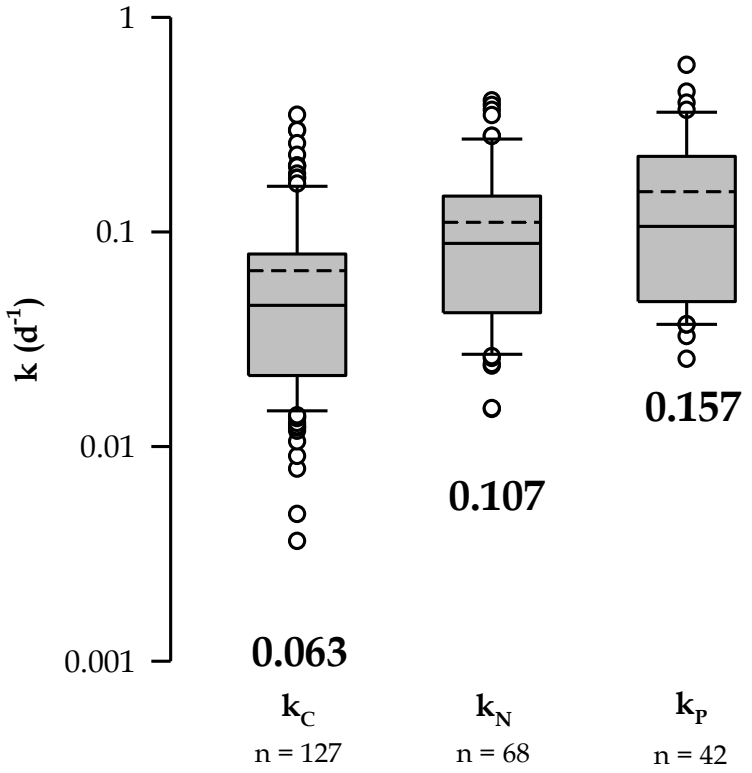


Ratio	C:	N:	P
Bioavailable DOM	195	26	1
Phyto. DOM	170	10	1
Refractory DOM	2835	159	1
River DOM	3495	118	1

River and plankton main contributor to DOM pool

Meybeck (1982); Lønborg&Álvarez-Salgado (2012)

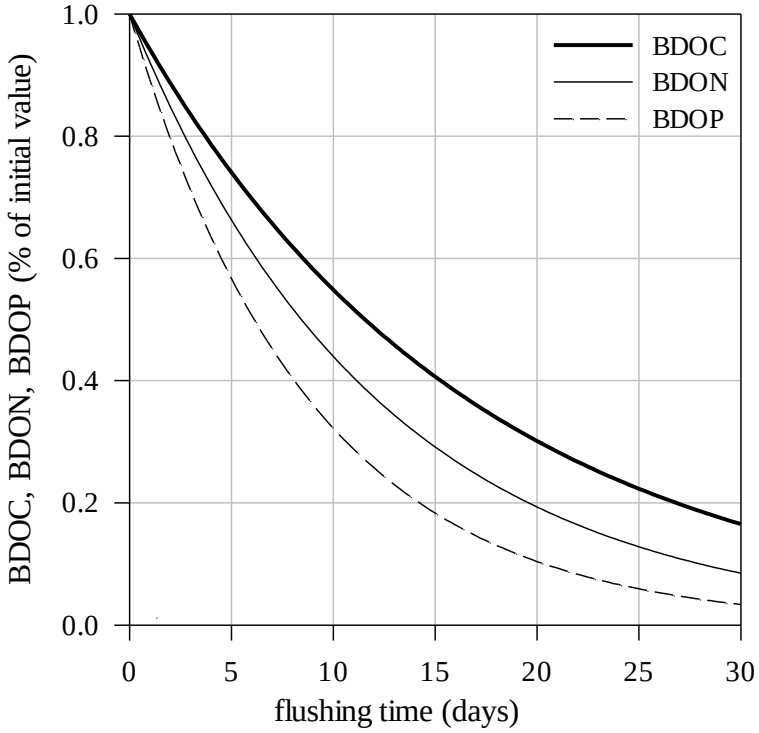
Kinetics of BDOM degradation



Reactivity gradient : P > N > C

Lønborg & Álvarez-Salgado (2012)

Modelling the BDOM degradation

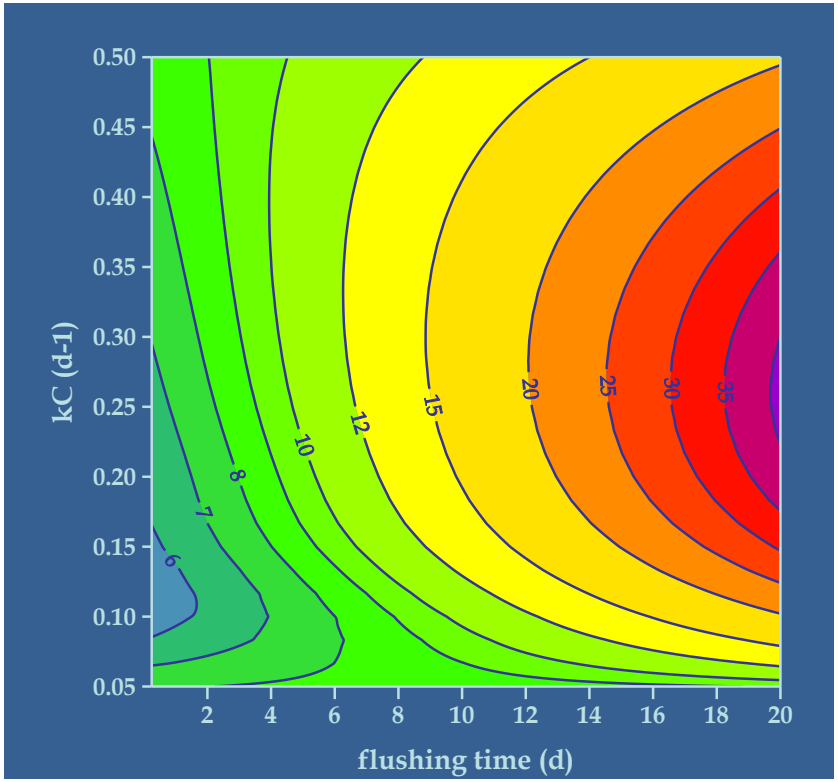


Longer flushing time less BDOM exported

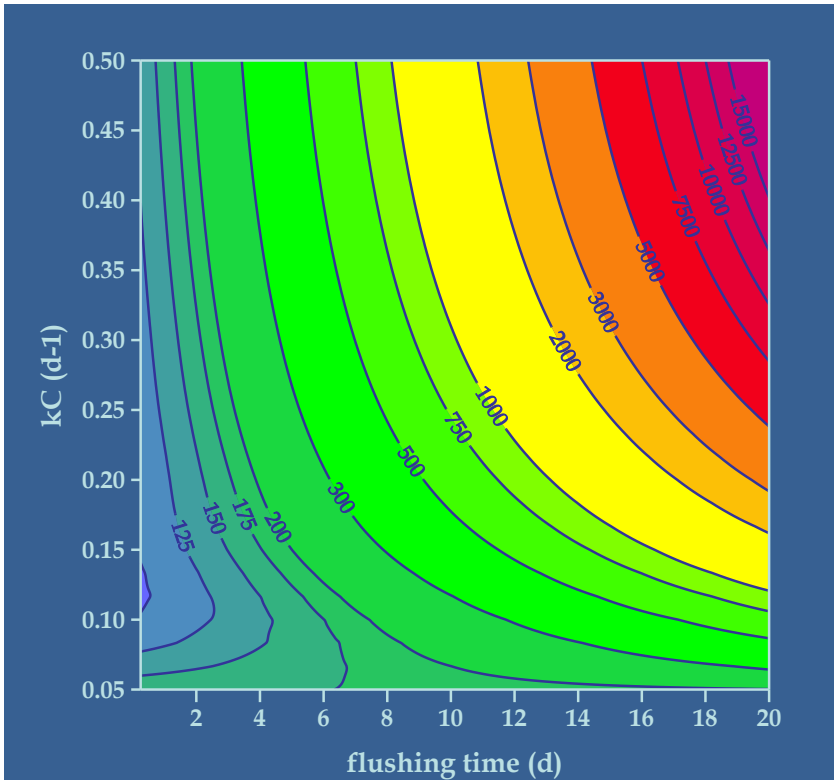
Lønborg & Álvarez-Salgado (2012)

Modelling the BDOM degradation

C/N of BDOM



C/P of BDOM



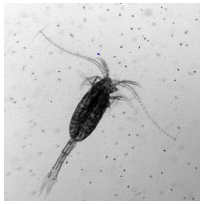
Longer flushing time - more carbon rich BDOM exported

Lønborg & Álvarez-Salgado (2012)

Conclusion

- DOM bioavailability and reactivity (P>N>C)
- Refractory DOM is conservatively mixed
- Plankton main contributor to BDOM
- Bioavailable DOM is exported

Case study 2: Bacterial and UV DOM degradation



Zooplankton

Antropogenic

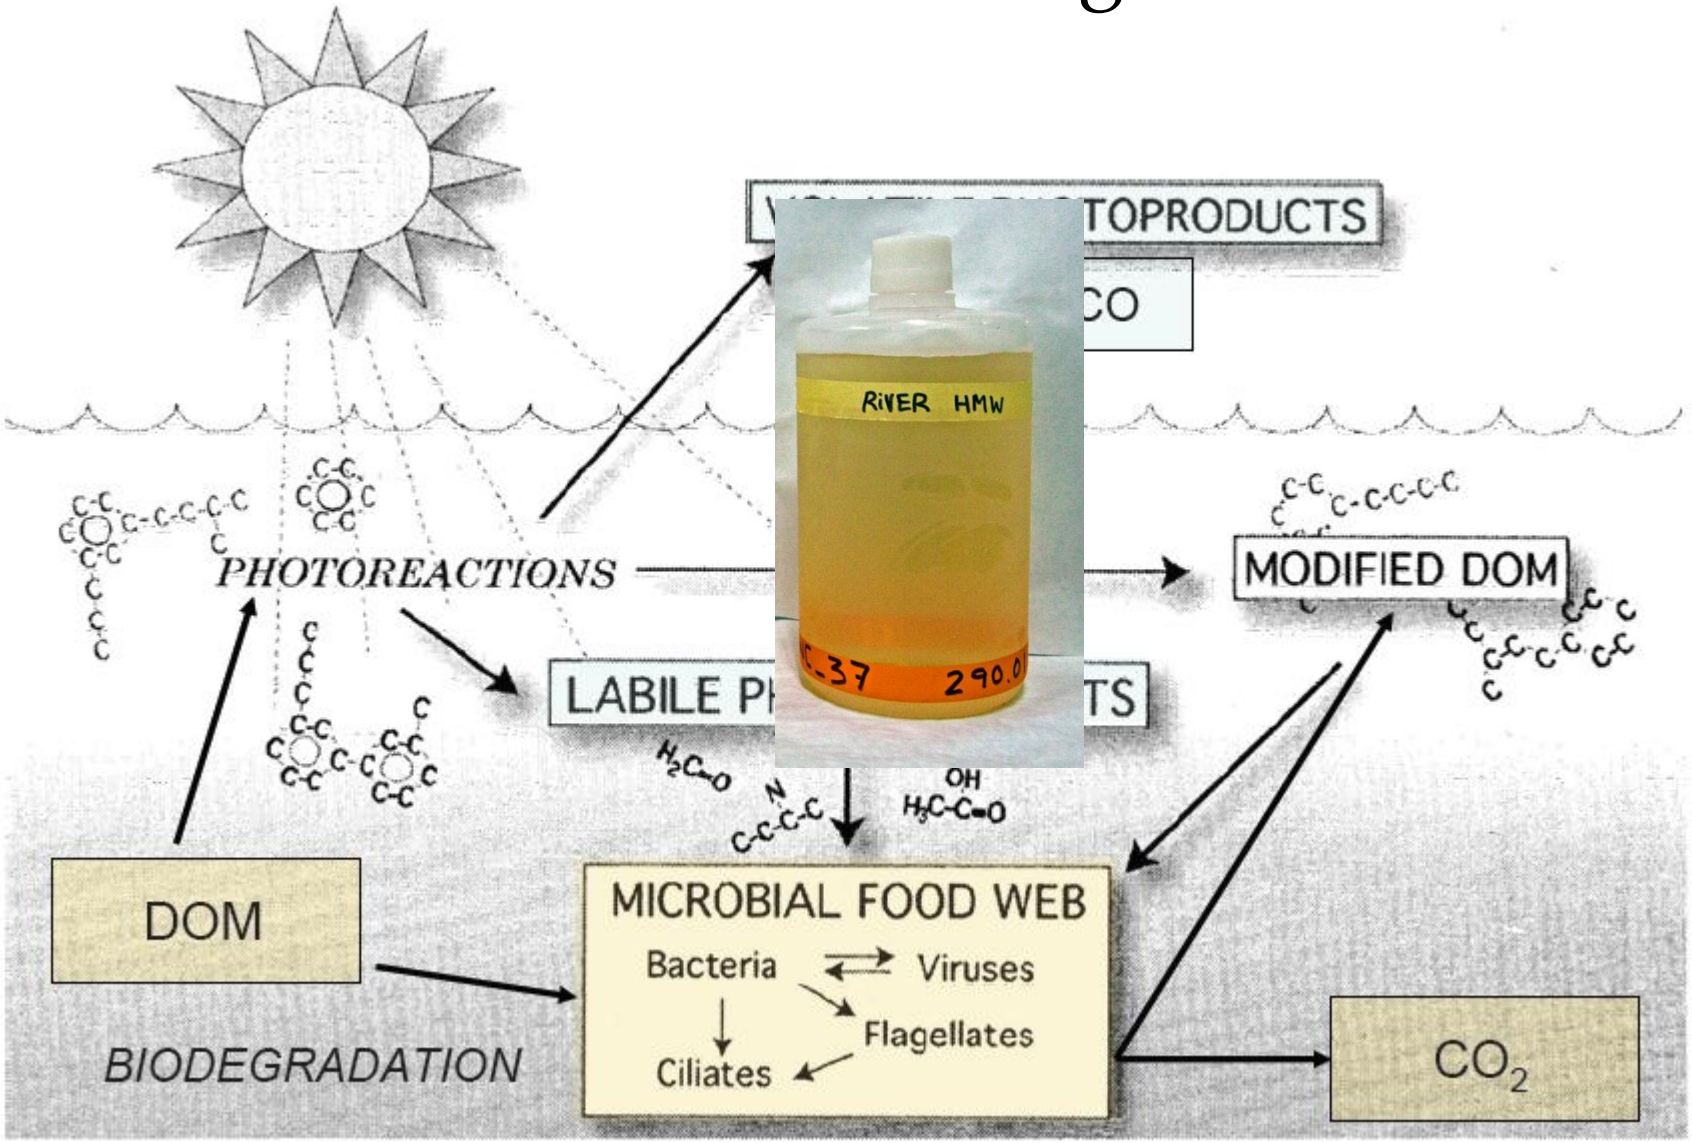
Photochemical DOM degradation

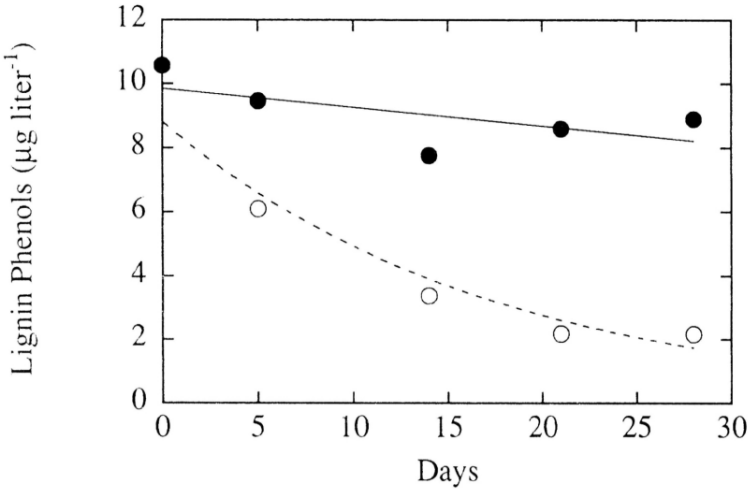


Moran& Covert (2003)

Microbes and photochemical processes

60% of river DOM is coloured (Aiken et al. 1985)

Sunlight - 96% of colour and 41% of DOC
(Vahatalo & Wetz 2004)

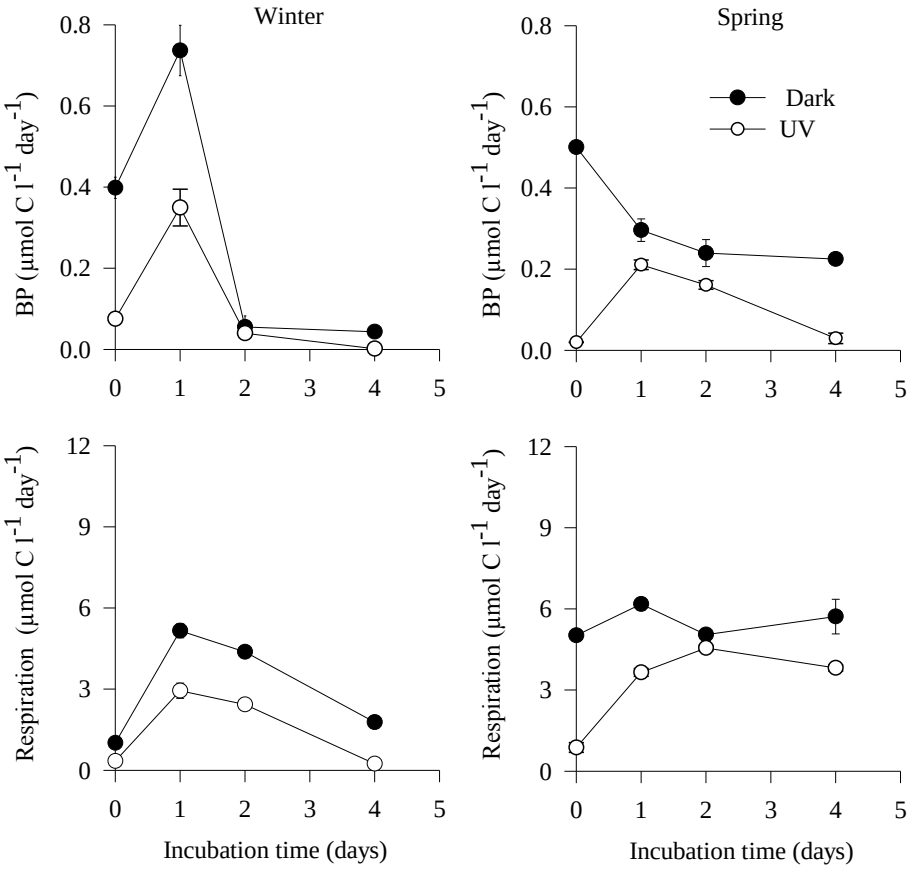


Photodegradation 5-fold greater (Opsahl & Benner 1998)

Combined microbial and photodegradation - 60% decrease in River DOM (Miller & Moran 1997)

Microbial and photodegradation together degrade DOM

Microbes and photochemical processes



DOC degradation also lower (Lønborg et al. 2013; Lønborg et al. in-prep)

UV-light negative impact on DOM degradation (Lønborg et al. 2013; Lønborg et al. in-prep)

Plankton DOM → negative effect DOM degradation
River DOM → positive effect DOM degradation

Conclusions

- Sunlight exposure degradation of DOM
- Microbial and photodegradation more efficient
- UV-light:

- negative effect on plankton DOM degradation
- positive effect on river DOM degradation

Research needs

Aggregation

Temperature impacts

Global ocean warming – Impact on DOM degradation ?

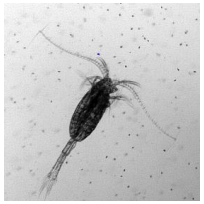
Q_{10} rate change with 10°C normally assumed to be 2

	Q_{10}	half-life (day)
Phytoplankton-derived DOC	1.7	6.3
Natural marine DOC (spring)	1.7	11
Natural marine DOC (summer)	1.8	6.9
Natural marine DOC (winter)	2.1	53
Humic DOC	2.7	152
Semirefractory DOC	3.8	3500
Semirefractory DOC	4.8	3500

- Q_{10} for DOM degradation varies between 1.7 – 4.8

What is the impact on foodweb and carbon cycle?

Lønborg et al. in-review



Zooplankton

Antropogenic

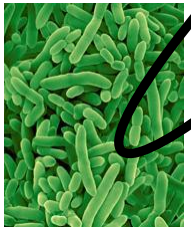
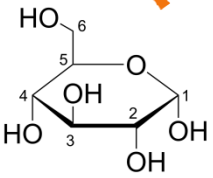
Sediment



Bacteria



Priming

Rivers

Aggregation

Priming effects in marine systems

+

= ?

• Refractory soil organic matter degradation – increase up to 600% when glucose added (Hamer et al. 2004)

• Some marine studies show effect on DOM degradation (Lønborg et al. unpubl. Results)

Does different DOM respond differently?

Summing up.....

- DOM bioavailability and reactivity (P>N>C)
- Bioavailable DOM is exported
- Microbial and photodegradation more efficient
- Plankton/river DOM respond differently

Research needs

- Increased flow of river DOM
- Temperature effects on DOM degradation
- Priming effects on DOM degradation
