Regional Ocean Modeling System

Coral Triangle Implementation

Motivation:

Conservation efforts within the Coral Triangle Initiative require understanding of:

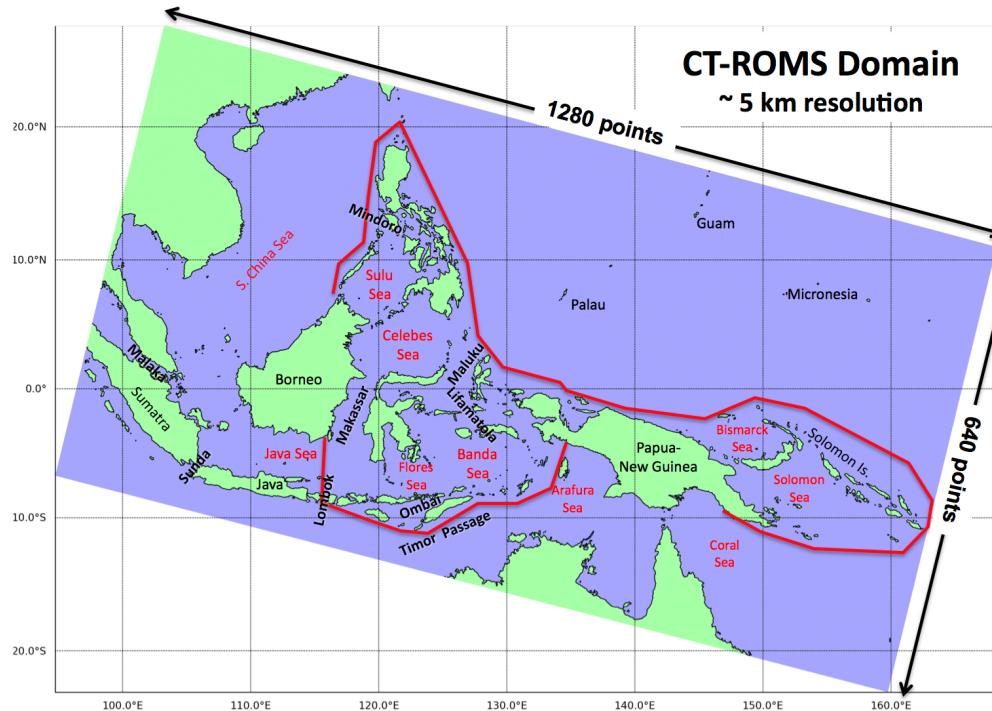

1. *How oceanographic circulation influences the susceptibility of coral reefs to bleaching*
2. *Ability of reefs to recolonize via larval-dispersal following a bleaching event*

Outline:

1. **Description of a circulation model to achieve this understanding**
2. **Comparison of model simulations with observations**
 - Flows through major passages
 - Tidal characteristics
 - Sea surface temperature
3. **Preliminary look at larval dispersal simulations**

Regional Ocean Modeling System

Coral Triangle Implementation

Bathymetry: global SRTM30_PLUS product with 30-sec resolution [Becker et al., 2009]

Vertical resolution: 50 terrain-following levels

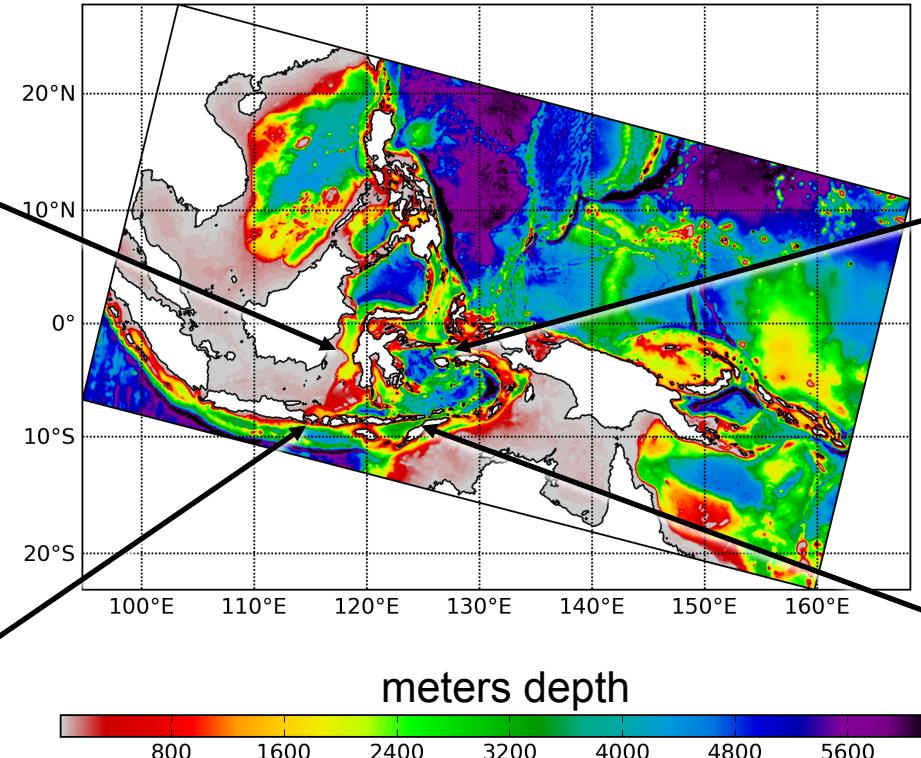

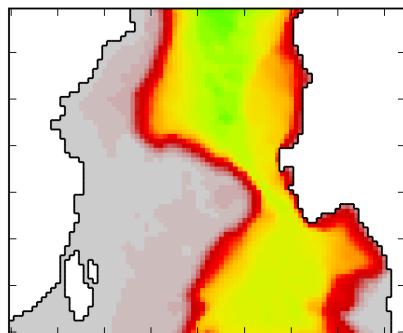

Atmospheric forcing: Modern Era-Retrospective Analysis for Research and Applications (MERRA, Rienecker et al., 2011)

Boundaries and initial conditions: Simple Ocean Data Assimilation (SODA, Carton et al., 2000)

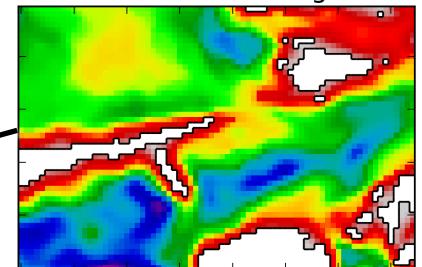

Tidal boundary conditions: global model of ocean tides TPXO 7.2 (Egbert and Erofeeva, 2002)

CT-ROMS Bathymetry

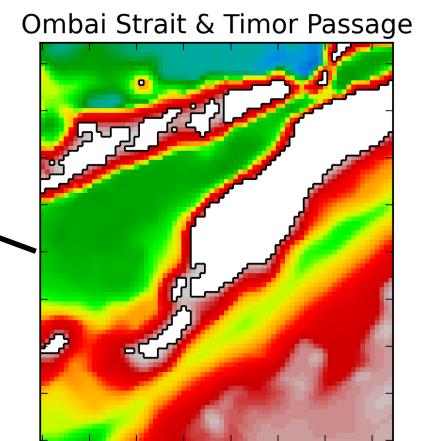

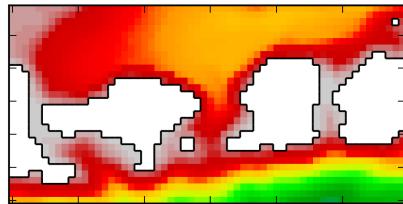

Makassar Strait - Labani Chanel

Lifamatola Passage

Lombok Strait

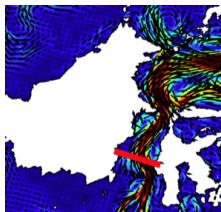

5 km resolution allows:

- representation of complex bathymetry
- coastlines
- dynamical features of circulation

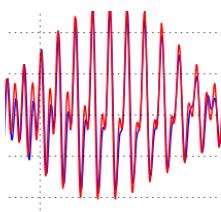

CT-ROMS

Evaluation against observations

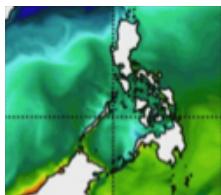

Transports through major passages

- INSTANT (International Nusantara Stratification and Transport Program) [Gordon et al., 2010]

Tidal constituents

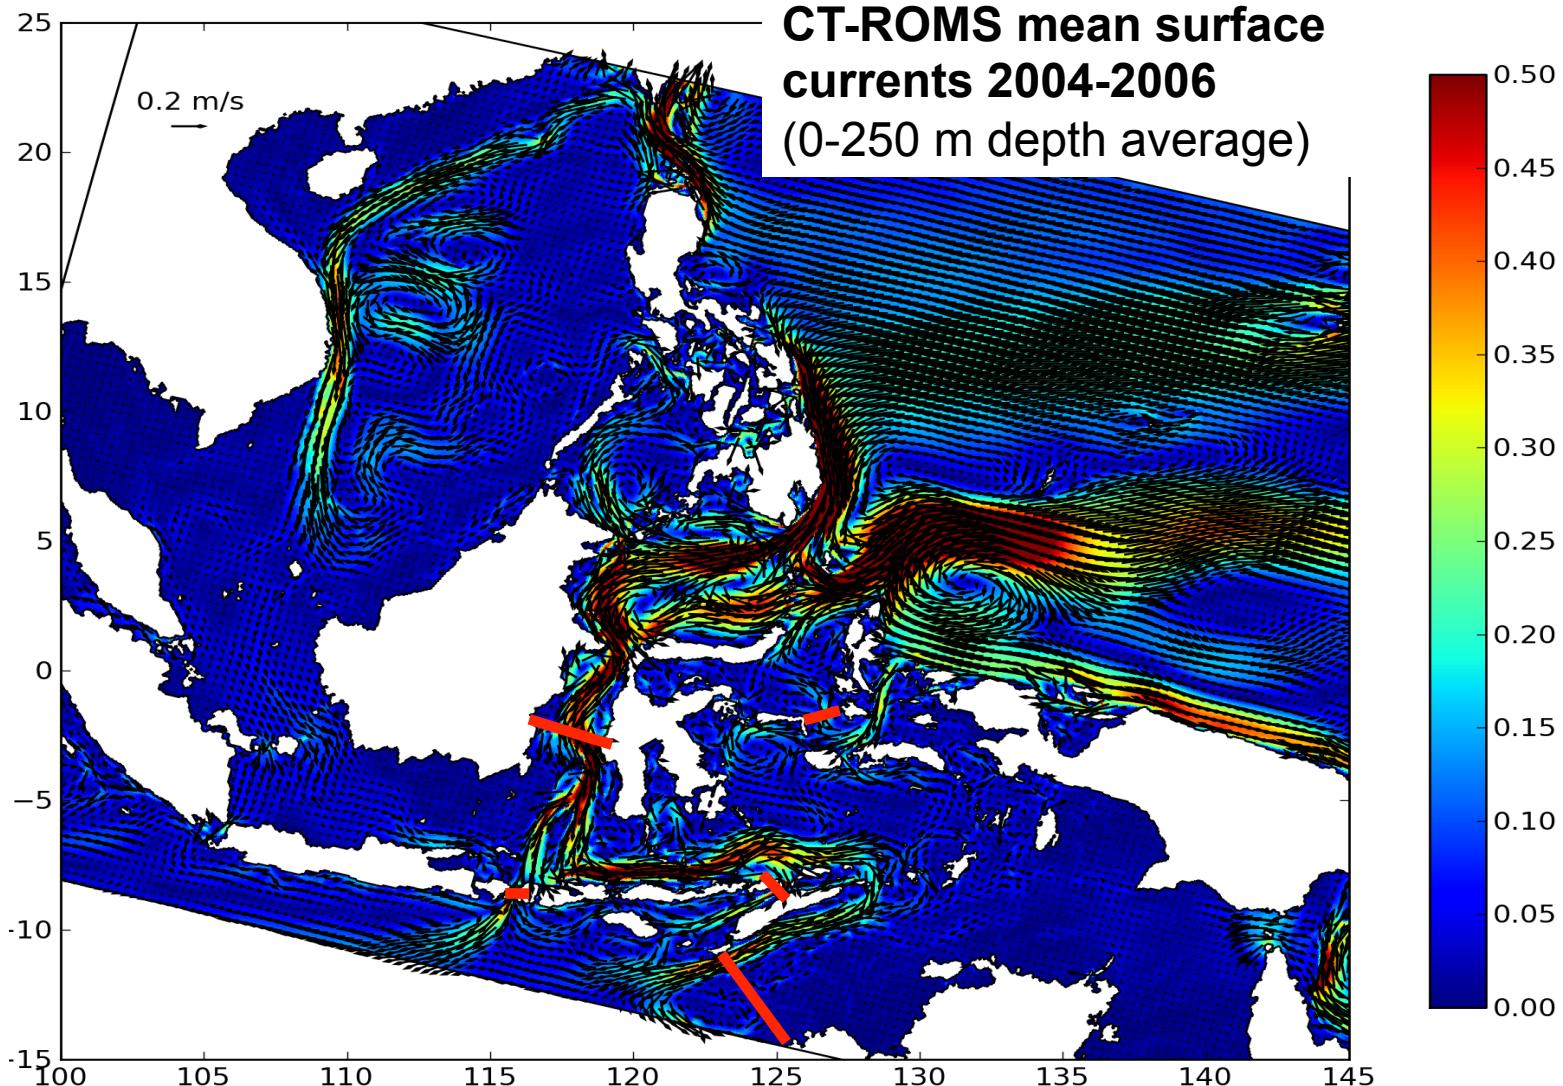

- Local tide gauges

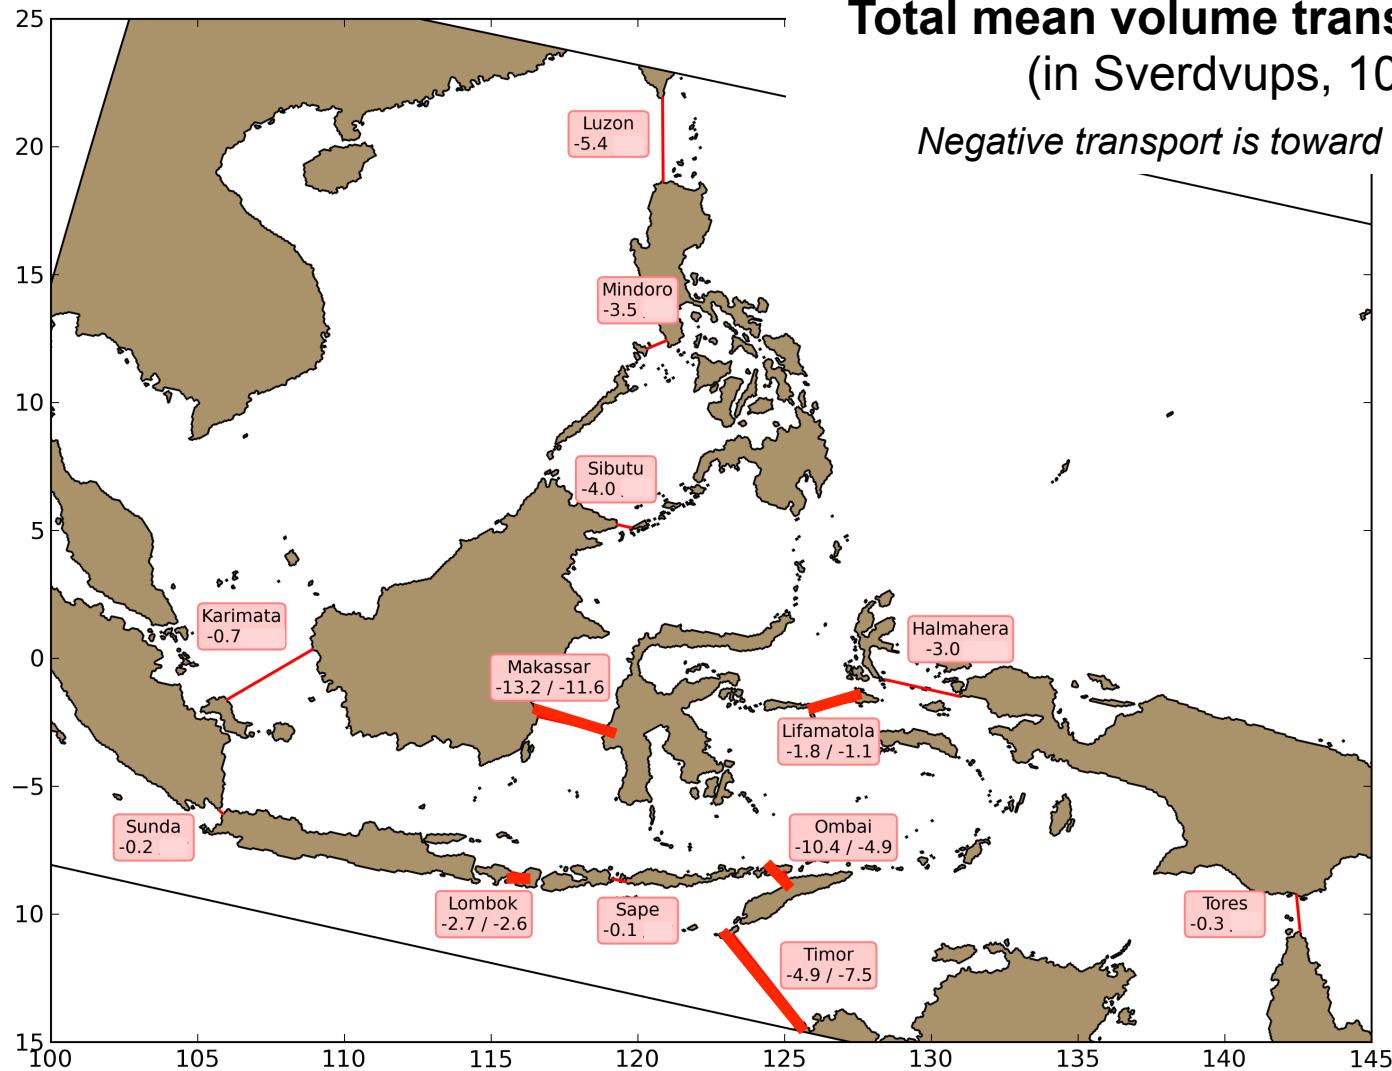

Sea surface temperature

- CoRTAD (Coral Reef Temperature Anomaly Database) [Selig et al., 2010]
- TAO moorings

Surface Currents and ITF Transports

Surface Currents and ITF Transports

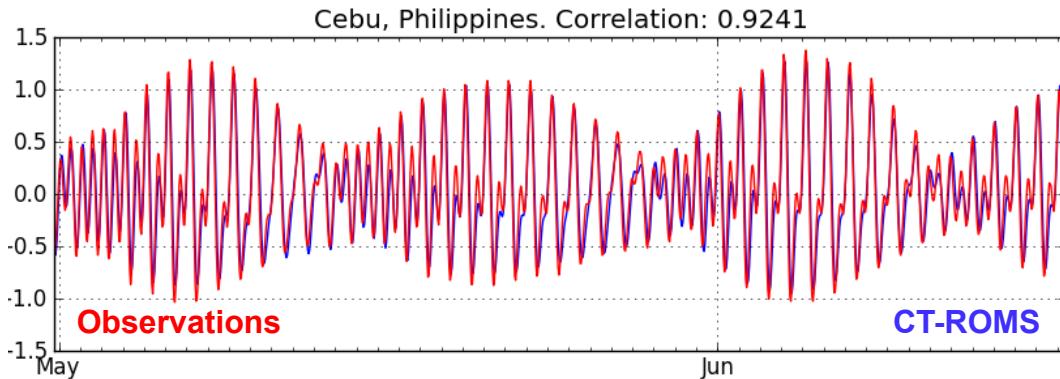

Total mean volume transport 2004-2006
(in Sverdvups, $10^6 \text{ m}^3 \text{ s}^{-1}$)

Negative transport is toward the Indian Ocean

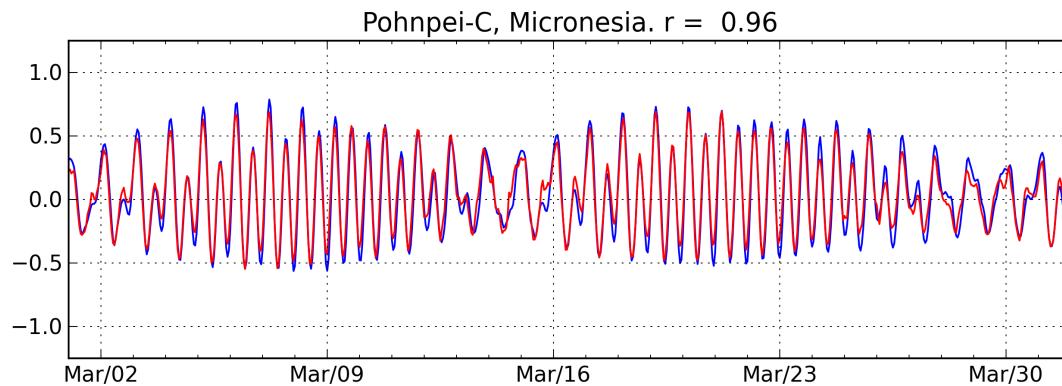

Strait
CT-ROMS / INSTANT

Red bars = straits with INSTANT observations

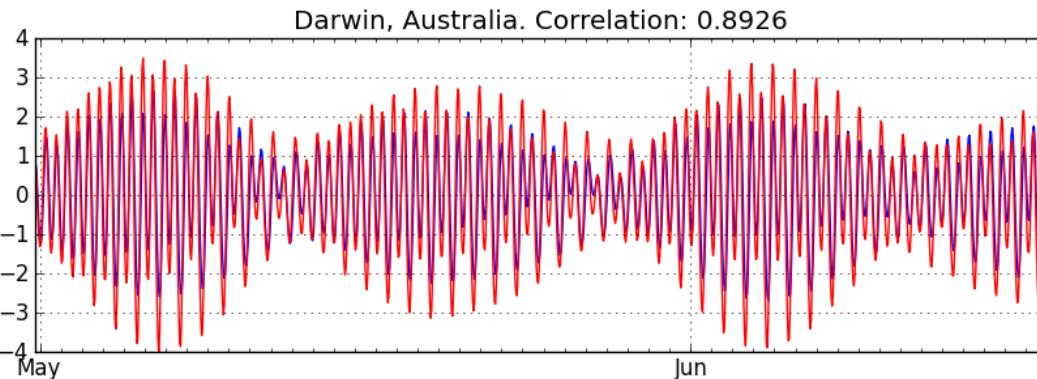

Water Levels at Tide Stations

Cebu, Philippines

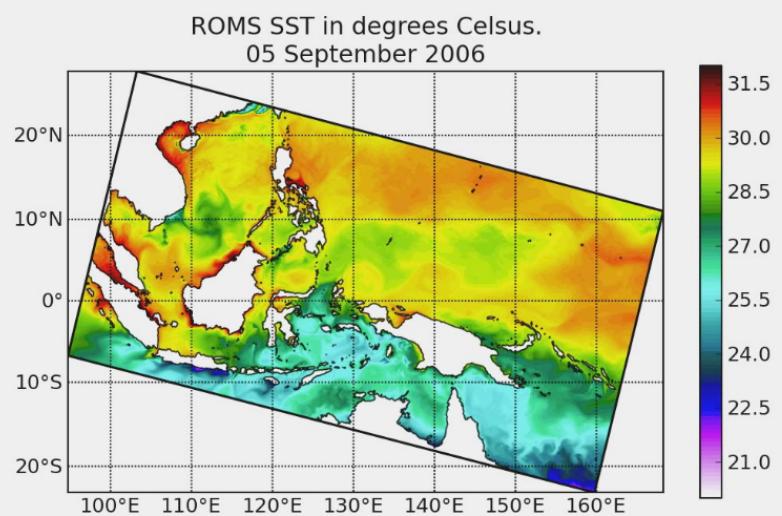

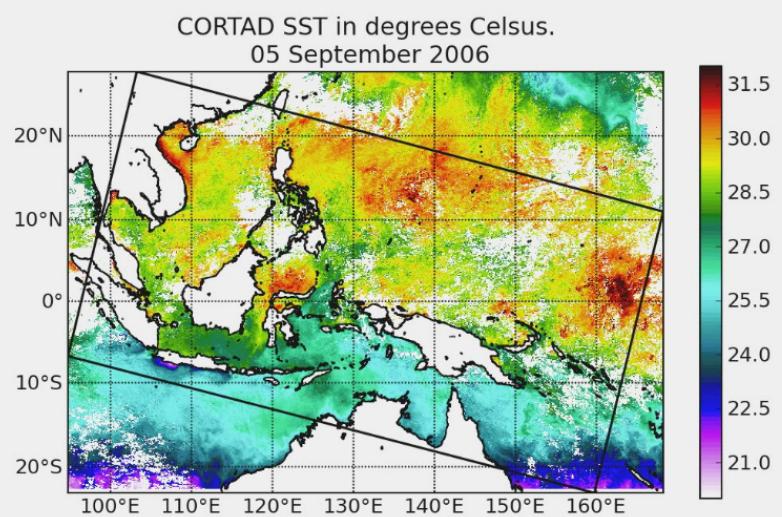

Pohnpei-C, Micronesia

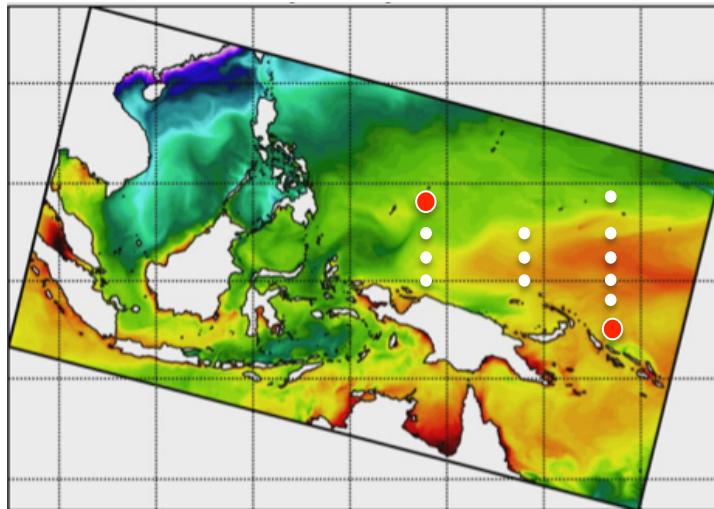

Darwin, Australia

Sea Surface Temperature

**CoRTAD weekly average SST
05 September 2006**

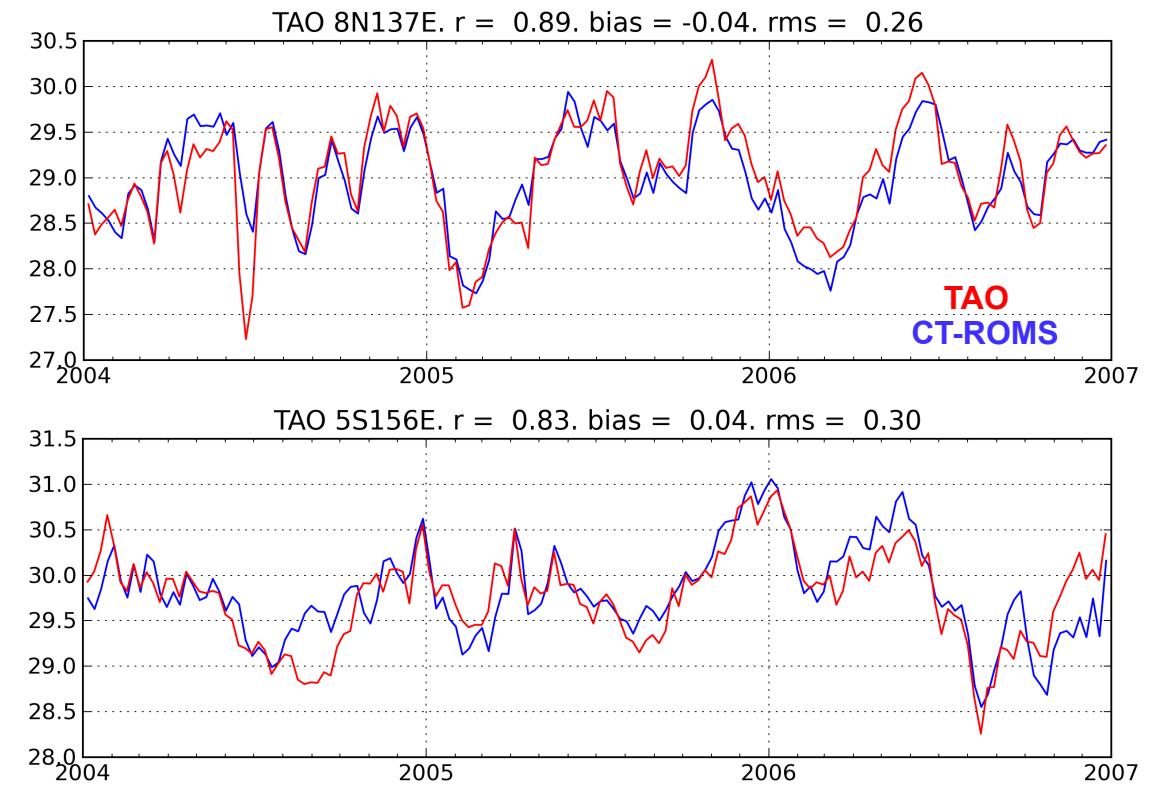

**CT-ROMS weekly average SST
05 September 2006**

CT-ROMS: Quick look at larval dispersal

Acropora millepora

- Widespread in the Coral Triangle
- Broadcast spawner
- April 1 spawning
- Precompetency
 - 3-4 days
 - T-dependent
- Mortality rate
- Settlement occurs once within a reef cell

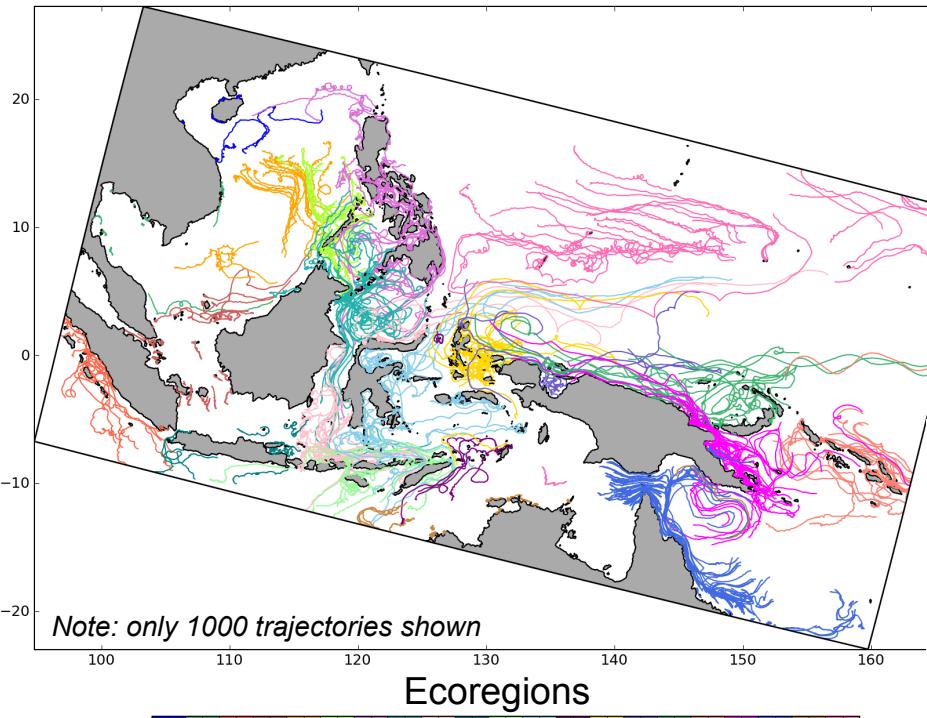

Coral Triangle Ecoregions

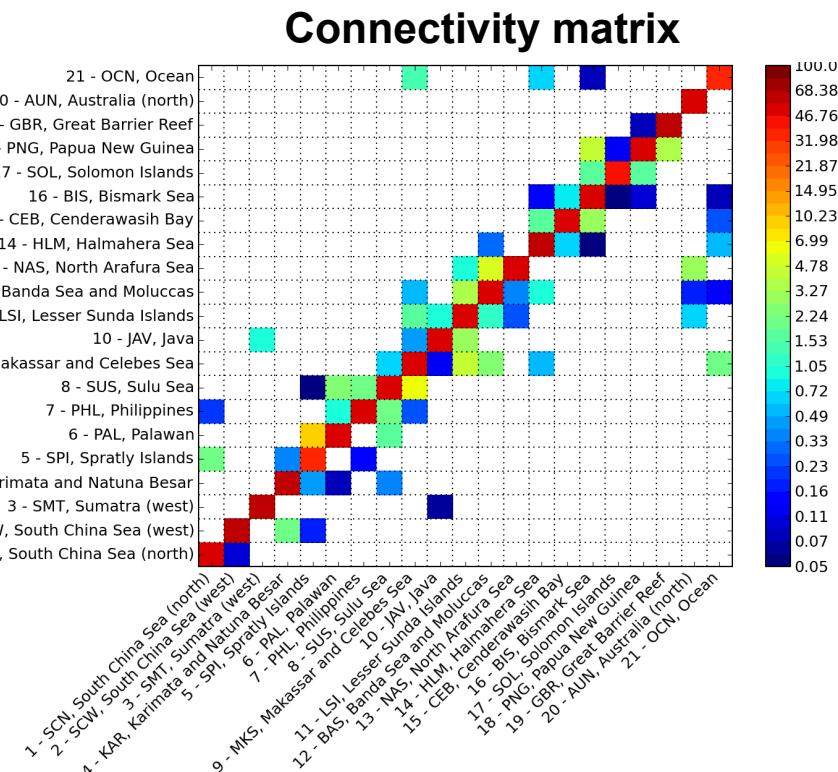

- Based on ecoregions of Veron et al. [2009] + additional regions outside the Coral Triangle
- 50,000 larvae labeled according to ecoregion
- Larvae tracked for 45 days
- Connectivity matrix calculated

CT-ROMS: Quick look at larval dispersal

45-day trajectories of *A. millepora* larvae

Most larvae are retained within the same ecoregion, but there is some long-distance connectivity

A high-resolution regional model for the Coral Triangle

Advantages of CT-ROMS

- Captures entire ITF region with significant skill
- Explicitly modeled tides (important to getting dynamics right)
- Suitable for climate-scale studies (e.g., coupling to global climate models)
- Ability to nest at higher resolution in targeted regions
- CT-ROMS improves our capacity to understand regional differences in vulnerability of coral reefs to climate change

A high-resolution regional model
for the Coral Triangle
